1. A rapid deploy containment device adapted to receive and retain a hazardous material, the containment device being moveable between an erect open configuration and a collapsed compact configuration, the containment device in the open configuration having a receptacle capable of receiving hazardous materials, the containment device comprising:
- rods, each rod being pivotally joined to another rod by a scissors connection intermediate the ends of said rod;
- hubs, each hub receiving an end portion of at least two rods along separate axes of each hub, said rods being pivotally joined to said hubs, where each of said rods pivot in relation to said hub along a single axis of rotation,
- said rods being rotatable about the single axis of revolution from the collapsed configuration where said rods are substantially parallel to one another to the erect open configuration; and
- a canopy connected to at least two hubs and residing in the receptacle of the erect containment device.
2. The containment device recited in claim 1, wherein each of said hubs includes flanges, said flanges receiving the ends of said rods.
3. The containment device recited in claim 2, wherein the end portion of each of said rods is pivotally joined to one of said flanges by a pin inserted through the end portion of said rod and received on said flange.
4. The containment device recited in claim 2, wherein at least two of said flanges lay substantially perpendicular to one another, whereby each of said hubs receives rods along a first

axis and a second axis perpendicular to the first axis.

5. The containment device recited in claim 4, wherein the ends of said substantially perpendicular flanges bend at right angles in either a clockwise or counterclockwise direction.

Sub 27
6. ~~The containment device recited in claim 5, wherein the end portion of each of said rods is pivotally joined to said flange by a pin inserted through the end portion of said rod and received on two of said flanges.~~
NAB ~~substantially on~~

7. The containment device recited in claim 1, wherein each of said hubs includes a base portion, the end portion of each of said rods being pivotally joined to said base portion by a pin inserted through the end portion of said rods and received on said base portion.

Sub 13
8. ~~The containment device recited in claim 2, wherein said hub includes a base portion, said flanges projecting from said base portion.~~

9. The containment device recited in claim 1, wherein each rod is of substantially equal length and wherein said scissor connection is proximate the middle of each rod.

10. ~~The containment device recited in claim 1, wherein at least two of said rods have a telescoping member, said rods having a hollow interior whereby said hollow interior slidably receives a small rod in said rod to provide extension of the containment device in the vertical and horizontal direction.~~

11. ~~The containment device recited in claim 1, further comprising a fastening mechanism connecting the upper and lower portions of the erect containment device.~~
NAB

12. ~~The containment device recited in claim 1, further comprising a stop positioned between the upper and lower portions of the erect containment device.~~
NAB

Sub 13
13. The containment device recited in claim 1, further comprising a liner positioned in
